

Lab 10 – File I/O and Graphics with JavaFX

Aim

This week lab is focused on reading from and writing to a file; and applying OOP techniques in drawing shapes with JavaFX.

Tips:

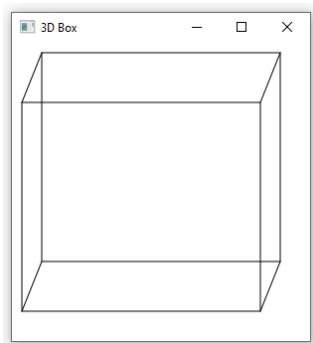

1. Try to run the codes and reproduce the results of Lecture 10 examples first.
2. Read the main/optional reading for more references and exercises.

Lab Task 10.1 Replace text from a textfile and write the result to a textfile

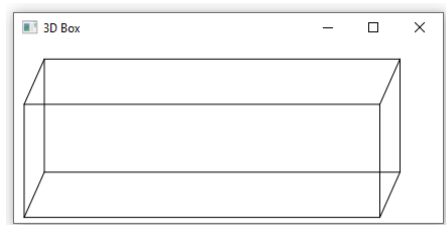

- Complete function **replaceText**(String sourceFileName, String targetFileName, String oldStr, String newStr).
- The function takes four strings and returns nothing.
- It operates on files and is given the source file name and the target file name.
- The task is to replace all occurrences of oldStr in the content of source file with newStr, and then write the result to the target file.
- Source file should exist.
- Target file should not exist.
- For the best practice, create a folder data on your project and use it to store the text files.

Lab Task 10.2 Draw a 3D box that can be resized

- Write a program that displays a **3D box** with JavaFX.

- The 3D box should grow/shrink as the window is resized.

This is the end of CPT111-2324 Lab 10 Task Sheet.
